## **Hopf-Galois Theory**

An extension L/K is Hopf-Galois if there is a K-Hopf algebra H and a K-algebra homomorphism  $\mu : H \to End_K(L)$  such that

• 
$$\mu(ab) = \sum_{(h)} \mu(h_{(1)}(a)\mu(h_{(2)})(b)$$

► 
$$L^H = \{a \in L \mid \mu(h)(a) = \epsilon(h)a \ \forall h \in H\} = k$$

• 
$$\mu$$
 induces  $I \otimes \mu : L \# H \xrightarrow{\cong} End_{\mathcal{K}}(L)$ 

As is known, the Hopf-Galois structures on a Galois extension L/K with G = Gal(L/K) are in 1-1 correspondence with the regular subgroups  $N \leq B = Perm(G)$  such that  $\lambda(G) \leq Norm_B(N)$ , where the Hopf algebra which acts is  $H_N = (L[N])^{\lambda(G)}$  the fixed ring under the simultaneous action of G on scalars and on N.

This implies that |N| = |G| but does not necessarily force N to be isomorphic to G, and indeed we may define

 $R(G) = \{N \le B \mid N \text{ regular and } \lambda(G) \le Norm_B(N)\}$  $R(G, [M]) = \{N \in R(G) \mid N \cong M\}$ 

where [M] represents any group of cardinality |G|.

Here however, we will, in fact, consider R(G, [G]) as this includes some primordial examples of the N which may arise.

For all G, we have  $N = \rho(G) \in R(G, [G])$  since  $\lambda(G)$  centralizes  $\rho(G)$  and thus certainly normalizes it, where  $H_{\rho(G)} \cong K[G]$  the group ring, i.e. the canonical action by virtue of G being the Galois group of L/K.

If G is non-abelian then  $\lambda(G) \neq \rho(G)$  and since  $\lambda(G)$  obviously normalizes itself we have  $\lambda(G) \in R(G, [G])$  where  $H_{\lambda(G)} = H_{\lambda}$  is the so-called *canonical non-classical* structure.

The relationship we focus on, as exemplified by  $\lambda(G)$  and  $\rho(G)$ , is that

$$Norm_B(\rho(G)) = Norm_B(\lambda(G)) = Hol(G)$$

▲□ ▶ ▲圖 ▶ ▲ 볼 ▶ ▲ 볼 ▶ ▲ 볼 ♡ � ᡤ 6/75

which leads to the discussion of the multiple holomorph of G.

For  $\lambda(G) \leq B = Perm(G)$ , one can ask for what other regular subgroups  $N \leq B$  have the same normalizer, (holomorph) as G, namely Hol(N) = Hol(G).

The equality implies that  $N \leq Hol(G)$  and  $\lambda(G) \leq Hol(N)$ .

If we restrict our attention to those N which are isomorphic to G then N is a conjugate of  $\lambda(G)$  by regularity.

So for such an N, where  $\tau \in B$  is such that  $\tau\lambda(G)\tau^{-1} = N$  then

$$\tau \operatorname{Norm}_{B}(\lambda(G))\tau^{-1} = \operatorname{Norm}_{B}(\tau\lambda(G)\tau^{-1})$$
$$= \operatorname{Norm}_{B}(N)$$
$$= \operatorname{Norm}_{B}(\lambda(G))$$

which means  $\tau \in Norm_B(Hol(G))$ , and the converse is true as well.

Let us make a few definitions:

$$\begin{aligned} & \mathsf{NHol}(G) = \mathsf{Norm}_B(\mathsf{Hol}(G)) = \mathsf{Norm}_B(\mathsf{Norm}_B(\lambda(G))) \\ & \text{the multiple holomorph of } G \\ & \mathsf{T}(G) = \mathsf{NHol}(G)/\mathsf{Hol}(G) \\ & \mathsf{H}(G) = \{\mathsf{N} \text{ regular } \mid \mathsf{N} \cong G \text{ and } \mathsf{Hol}(\mathsf{N}) = \mathsf{Hol}(G) \} \end{aligned}$$

We observe that  $\mathcal{H}(G) \subseteq R(G, [G])$ , and the virtue of this is that  $\mathcal{H}(G)$  (for many different G) may be readily enumerated.

We have the following basic fact(s) about T(G) and  $\mathcal{H}(G)$ . Proposition

Given the above definitions:

$$\begin{aligned} Orb_{\mathcal{T}(G)}(\lambda(G)) &= \mathcal{H}(G) \\ &= \{ N \text{ regular } \mid N \cong G \text{ and } N \triangleleft Hol(G) \} \\ &= Orb_{\mathcal{T}(G)}(N) \text{ for any } N \in \mathcal{H}(G) \end{aligned}$$

◆□ → < @ → < ≧ → < ≧ → ≧ < つへで 9/75</p>

and in particular  $|T(G)| = |\mathcal{H}(G)|$ .

The multiple holomorph of finite abelian groups was determined by G.A. Miller [4] in the early 1900's and what was utlimately discovered was that |T(G)| is trivial if G has odd order, and  $|T(G)| \le 4$  in general.

Indeed, for many groups |T(G)| = 2, i.e.  $\mathcal{H}(G) = \{\lambda(G), \rho(G)\}$ , for example, if G is a non-abelian simple group, or complete.

Since then T(G) has been computed for other classes of groups, by Caranti for perfect groups [1], and p-groups of class two [2], and the presenter [3] for the case of dihedral groups.

And indeed, for our discussion, we shall focus on the case where  $G \cong D_n$ .

◆□▶ < @ ▶ < E ▶ < E ▶ E のQ ○ 10/75</p>

We examine the case where  $G \cong D_n$  for  $n \ge 3$  since both  $\mathcal{H}(G)$  and  $\mathcal{T}(G)$  are worked out in detail in [3].

We present the *n*-th dihedral group as follows:

$$D_n = \{x, t \mid x^n = 1, t^2 = 1, xt = tx^{-1}\}$$
  
=  $\{1, x, x^2, \dots, x^{n-1}, t, tx, tx^2, \dots, tx^{n-1}\}$ 

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ <

and we also have a presentation of  $Aut(D_n)$ .

Proposition For  $n \ge 3$  with  $D_n = \{t^a x^b | a \in \mathbb{Z}_2; b \in \mathbb{Z}_n\}$  and letting  $U_n = \mathbb{Z}_n^*$ , (a)  $Aut(D_n) = \{\phi_{i,j} | i \in \mathbb{Z}_n; j \in U_n\}$  where

$$\phi_{i,j}(t^a x^b) = t^a x^{ia+jb}$$
  

$$\phi_{i_2,j_2} \circ \phi_{i_1,j_1} = \phi_{i_2+j_2i_1,j_2j_1}$$
  

$$\phi_{(0,1)} = I \quad the \ identity$$

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

(b)  $Aut(D_n) \cong Hol(\mathbb{Z}_n)$ 

The groups in  $\mathcal{H}(D_n)$  are subgroups of  $Hol(D_n)$  where typical elements have the form

$$(t^a x^b, \phi_{i,j})$$

and if we make the identification  $\rho(t^i x^j) = (t^i x^j, I) \in Hol(D_n)$ then since  $\lambda(D_n)$  is the centralizer of  $\rho(D_n)$  we have

$$\lambda(t^{i}x^{j}) = (t, \phi_{(0,-1)})^{i}(x, \phi_{(2,1)})^{j}$$

## The description of $\mathcal{H}(D_n)$ is given in [3, Theorem 2.11] Theorem

$$\mathcal{H}(D_n) = \{ \langle (x, \phi_{(u+1,1)}), (t, \phi_{(0,-u)}) \rangle \mid u \in \Upsilon_n \}$$

where

$$\Upsilon_n = \{ u \in U_n \mid u^2 = 1 \}$$

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

the group of exponent 2 units mod n.

The size and structure of the group  $\Upsilon_n$  is basically determined by the number of quadratic residues of n, which in turn is keyed to the number of prime divisors of n vis-a-vis the Chinese Remainder Theorem, and is given below.

Lemma

For 
$$n = 2^e p_1^{f_1} p_2^{f_2} \cdots p_r^{f_r}$$
,  $\Upsilon_n \cong \begin{cases} (\mathbb{Z}_2)^r & e <= 1 \\ (\mathbb{Z}_2)^{r+1} & e = 2 \\ (\mathbb{Z}_2)^{r+2} & e \ge 3 \end{cases}$ 

For  $u \in \Upsilon_n$  let

$$N_{u} = \langle (x, \phi_{(u+1,1)}), (t, \phi_{(0,-u)}) \rangle$$
$$= \langle x_{u}, t_{u} \rangle$$

< □ > < @ > < \ > < \ > > \ = の < ♡ < 0 / 16/75

and we note that  $N_{-1} = \rho(D_n)$  and  $N_1 = \lambda(D_n)$ .

More generally, by [3, Corollary 1.13] we have, for any  $N_u \in \mathcal{H}(D_n)$ , that  $N_u^{opp} = Cent_B(N_u) = N_{-u}$ .

As we wish to consider the fixed rings  $H_N = (L[N])^G$  where the G acting on N is  $\lambda(G)$  of course, we have the following, which also comes from [3]. If we let  $r = x_1 = \lambda(x)$  and  $f = t_1 = \lambda(t)$  then

#### Proposition

 $\lambda(D_n) = \langle r, f \rangle$  acts on  $N_u = \langle x_u, t_u \rangle$  as follows:

$$rx_{u}r^{-1} = x_{u}$$

$$rt_{u}r^{-1} = t_{u}x_{u}^{-(u+1)}$$

$$fx_{u}f^{-1} = x_{u}^{-u}$$

$$ft_{u}f^{-1} = t_{u}$$

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶

With this we can establish the following.

### Theorem

For each  $N_u \in \mathcal{H}(D_n)$ , none of the  $H_{N_u} = (L[N_u])^{D_n}$  are isomorphic as Hopf algebras.

## Proof.

Let 
$$u, v \in \Upsilon_n$$
 with  $N_u = \langle x_u, t_u \rangle$  and  $N_v = \langle x_v, t_v \rangle$ .

If there were a  $\lambda(D_n)$ -invariant isomorphism  $\psi: N_u \to N_v$  then  $\psi(x_u) = x_v^w$  for some unit w.

But for  $\psi$  to be  $\lambda(D_n)$ -invariant, then looking at how  $f = t_1$  acts one would need that  $-uw \equiv -vw \pmod{n}$  which is impossible since  $u \neq v$ .

[Note: We utilize the fact that  $H_N \cong H_{N'}$  as Hopf-algebras iff there is a  $\lambda(G)$ -invariant isomorphism from N to N'.] Our next question is, what about the potential isomorphisms that may exist between the  $H_{N_u}$  as *K*-algebras?

For this, we begin by constructing a basis for  $H_{N_u}$  which will allow us to analyze the basic structure of them as rings.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

For  $u \in \Upsilon_n$  let

$$N_{u} = \langle (x, \phi_{(u+1,1)}), (t, \phi_{(0,-u)}) \rangle$$
$$= \langle x_{u}, t_{u} \rangle$$

< □ ▶ < @ ▶ < \ > ▲ \ > ↓ \ = り < \ > 20/75

and we note that  $N_{-1} = \rho(D_n)$  and  $N_1 = \lambda(D_n)$ .

More generally, by [3, Corollary 1.13] we have, for any  $N_u \in \mathcal{H}(D_n)$ , that  $N_u^{opp} = Cent_B(N_u) = N_{-u}$ .

As to the case where n is even. We can utilize the enumeration discussed earlier this week.

Those *N* where  $Norm_B(N) \leq W(X_0, Y_0)$ , can be parameterized as  $N_{u,v}$  where  $u \in \Upsilon_n$  and v = 1, and, if 8|n also for  $v = \frac{n}{2} + 1$  where  $N_{u,1} = N_u \in \mathcal{H}(D_n)$ .

For our purposes, the we can focus on how  $\lambda(D_n)$  acts on the characteristic index 2 subgroup which we can denote  $K_{u,v} = \langle k_{u,v} \rangle$ . For  $r = \lambda(x)$  and  $f = \lambda(t)$  we have

### Proposition

 $\lambda(D_n)=\langle r,f\rangle$  acts on  $K_{u,v}=\langle k_{u,v}\rangle$  as follows:

$$rk_{u,v}r^{-1} = k_{u,v}^{v}$$
$$fk_{u,v}f^{-1} = k_{u,v}^{u}$$

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶

With this in mind, we can establish the following:

#### Theorem

If n even, and  $Norm_B(N) \leq W(X_0, Y_0)$  where  $N = N_{u,v}$  for  $u \in \Upsilon_n$ and v = 1 or  $v = \frac{n}{2} + 1$  one has that there is no  $\lambda(D_n)$  invariant isomorphism  $\psi : N_{u_1,v_1} \to N_{u_2,v_2}$  unless  $u_1 = u_2$  and  $v_1 = v_2$ .

#### Proof.

If  $K_{u_i,v_i} = \langle k_{u_i,v_i} \rangle$  are the index 2 characteristic subgroups then any such  $\psi : N_{u_1,v_1} \to N_{u_2,v_2}$  must map  $k_{u_1,v_2} \mapsto k_{u_2,v_2}^w$  for some  $w \in U_n$ . However, by virtue of how  $\lambda(D_n)$  acts, this would require

$$v_1 w \equiv v_2 w$$
$$u_1 w \equiv u_2 w$$

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

which, since  $w \in U_n$  implies  $u_1 = u_2$  and  $v_1 = v_2$ .

## Corollary

For n even, and N such that  $Norm_B(N) \leq W(X_0, Y_0)$  no two of the resulting fixed rings  $(L[N])^{D_n}$  are isomorphic as Hopf-algebrs.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - 釣へで 23/75

For those N where  $Norm_B(N) \leq W(X_1, Y_1)$ , we have that  $N = N_{v,r}$  where  $v \in \Upsilon_n$  and  $r \in \mathbb{Z}_n - \langle 2 \rangle$ .

Again we can focus on how  $\lambda(D_n)$  acts on the characteristic index 2 subgroup which we can denote  $K_{\nu,r} = \langle k_{\nu,r} \rangle$ , specifically For  $r = \lambda(x)$  and  $f = \lambda(t)$  we have

#### Proposition

 $\lambda(D_n) = \langle r, f \rangle$  acts on  $K_{v,r} = \langle k_{v,r} \rangle$  as follows:

$$rk_{v,r}r^{-1} = k_{v,r}^{v}$$
  
 $fk_{v,r}f^{-1} = k_{v,r}^{-1}$ 

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

And in a similar fashion to the previous example, we can conclude that

## Theorem

For  $N_{v,r}$  as above, if  $v_1 \neq v_2$  then  $N_{v_1,r_1}$  is not  $\lambda(D_n)$ -isomorphic to  $N_{v_2,r_2}$  and therefore the resulting fixed rings are not isomorphic as Hopf algebras.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへで 25/75

For later reference, we can determine  $N_u \cap \rho(D_n)$  as this determines  $G(H_{N_u})$ .

#### Proposition

For  $N_u = \langle x_u, t_u \rangle \in \mathcal{H}(D_n)$  we have

$$N_u \cap \rho(D_n) = \langle x_u^{rac{n}{\gcd(u+1,n)}} 
angle$$

which equals  $\langle x_{-1}^{\frac{n}{gcd(u+1,n)}} \rangle$  a cyclic group of order gcd(u+1,n).

**Notation:** As we will use it throughout the subsequent discussion we set  $d_u = gcd(u+1, n)$  for  $u \in \Upsilon_n$ , and also define  $m_u = \frac{n}{d_u}$ .

◆□▶ < @ ▶ < E ▶ < E ▶ E りへで 26/75</p>

# Basis for $H_{N_u}$

For a given regular N normalized by  $\lambda(G)$ , a basis for  $H_N = (L[N])^G$  can be given that is universal in that it is defined for any L/K and N.

## Proposition

Let  $\alpha \in L$  be a normal basis generator for L/K with the property that  $tr(\alpha) = 1$ . Let N be a regular subgroup of B = Perm(G)which is normalized by  $\lambda(G)$ . If for each  $n \in N$  we define

$$v_n = \sum_{g \in G} g(\alpha) \lambda(g) n \lambda(g)^{-1}$$

<□ ▶ < □ ▶ < 三 ▶ < 三 ▶ ミ ● ○ Q ( 27/75

then the set  $\{v_n\}$  is a basis for  $H_N = (L[N])^G$ .

## **Proof:**

We begin by verifying that each  $v_n$  lies in H.

Let  $t \in G$  and observe

$$t(v_n) = \sum_{g \in G} t(g(\alpha))\lambda(t)\lambda(g)n\lambda(g)^{-1}\lambda(t)^{-1}$$
$$= \sum_{g \in G} (tg)(\alpha)\lambda(tg)n\lambda(tg)^{-1}$$
$$= v_n$$

<□ > < @ > < E > < E > E の Q C 28/75

so that  $v_n \in H$ .

Note that  $v_{e_N} = e_N$  where  $e_N$  is the identity of N.

As there are  $|N| = |G| = dim_k(H)$  different  $v_n$  we prove that they are a basis for H by proving linear independence. For computational convenience let

$$\pi^{-1}(m) = \{(g,n) \in G \times N \mid \lambda(g)n\lambda(g)^{-1} = m\}$$

and suppose now that  $\sum_{n\in \textit{N}} c_n v_n = 0$  for  $c_n \in \textit{k},$  that is

$$0 = \sum_{n \in N} \sum_{g \in G} c_n g(\alpha) \lambda(g) n \lambda(g)^{-1}$$
$$= \sum_{m \in N} \left( \sum_{(g,n) \in \pi^{-1}(m)} c_n g(\alpha) \right) m$$

which means that for each  $m \in N$  we have

$$\sum_{(g,n)\in\pi^{-1}(m)}c_ng(\alpha)=0$$
(1)

but does this imply that each  $c_n$  in this sum is zero?

Since  $\lambda(G)$  normalizes N then each  $\lambda(g)$  acts as an automorphism of N.

As such, if  $(g, n_1), (g, n_2) \in \pi^{-1}(m)$  then one must have  $n_1 = n_2$ and therefore, for all the  $(g, n) \in \pi^{-1}(m)$ , the g's are all distinct.

As such the left hand side of (1) is a linear combination of *distinct*  $g(\alpha)$  which means that for each  $(g, n) \in \pi^{-1}(m)$  one has  $c_n = 0$ .

◆□▶ < @ ▶ < E ▶ < E ▶ E りへで 30/75</p>

And since this holds true for all  $m \in N$  then all  $c_n = 0$ .

We have complete information on how  $\lambda(D_n) = N_1$  conjugates elements of  $N_u$  and thus may start constructing the  $v_n$  bases for each  $n = t_u^i x_u^j \in N_u$ .

We define  $F = L^{\langle r \rangle}$  and for  $\alpha$  a normal basis generator of L/K, we define  $\beta = tr_{L/F}(\alpha) = \sum_{b=0}^{n-1} r^b(\alpha)$ .

We also observe that  $1 = tr_{L/K}(\alpha) = tr_{F/K}(tr_{L/F}(\alpha)) = \beta + f(\beta)$  which we will use below.

**Notation:** As we will use it throughout the subsequent discussion we set  $d_u = gcd(u+1, n)$  for  $u \in \Upsilon_n$ , and also define  $m_u = \frac{n}{d_u}$ .

◆□▶ < @ ▶ < E ▶ < E ▶ E りへで 31/75</p>

For  $x_u^j \in N_u$  we have

$$\begin{aligned} \mathbf{v}_{\mathbf{x}_{u}^{j}} &= \sum_{a=0}^{1} \sum_{b=0}^{n-1} (f^{a} r^{b}(\alpha)) (f^{a} r^{b}) \mathbf{x}_{u}^{j} (f^{a} r^{b})^{-1} \\ &= \sum_{b=0}^{n-1} (r^{b}(\alpha)) \mathbf{x}_{u}^{j} + (fr^{b}(\alpha)) \mathbf{x}_{u}^{-uj} \\ &= tr_{L/F}(\alpha) \mathbf{x}_{u}^{j} + f(tr_{L/F}(\alpha)) \mathbf{x}_{u}^{-uj} \\ &= \beta \mathbf{x}_{u}^{j} + f(\beta) \mathbf{x}_{u}^{-uj} \\ &= \beta \mathbf{x}_{u}^{j} + (1-\beta) \mathbf{x}_{u}^{-uj} \end{aligned}$$

and we observe that,  $v_{x_u^j} = x_u^j$  if and only if j = -uj which is equivalent to  $j(u+1) \equiv 0 \pmod{n}$ , namely  $j \in \langle m_u \rangle$ . i.e.  $N_u \cap \rho(D_n)$ .

For  $t_u x_u^j \in N_u$  we have

$$\begin{aligned} v_{t_{u}x_{u}^{j}} &= \sum_{a=0}^{1} \sum_{b=0}^{n-1} (f^{a}r^{b}(\alpha))(f^{a}r^{b})t_{u}x_{u}^{j}(f^{a}r^{b})^{-1} \\ &= \sum_{b=0}^{n-1} r^{b}(\alpha)r^{b}(t_{u}x_{u}^{j})r^{-b} + (fr^{b}(\alpha))(fr^{b})t_{u}x_{u}^{j}(fr^{b})^{-1} \\ &= \sum_{b=0}^{n-1} r^{b}(\alpha)t_{u}x_{u}^{j-b(u+1)} + fr^{b}(\alpha)t_{u}x_{u}^{b(u+1)-uj} \end{aligned}$$

Looking at the coefficients and group element exponents in the above sum, we see the appearance of j - b(u+1) and b(u+1) - uj as b varies over  $\mathbb{Z}_n$ .

<□ ▶ < @ ▶ < E ▶ < E ▶ 2 ∽ Q ↔ 33/75

#### Proposition

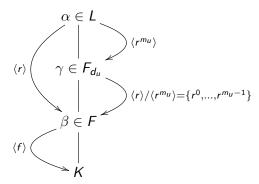

For 
$$m_u = \frac{n}{d_u}$$
 as defined earlier, if  $b \equiv b' \pmod{m_u}$  then  
 $j - b(u+1) \equiv j - b'(u+1) \pmod{n}$ , and  
 $b(u+1) - uj \equiv b'(u+1) - uj \pmod{n}$ .

As such, if we define  $W_e = \{t \in \mathbb{Z}_n \mid t \equiv e \pmod{m_u}\}$  for  $e = 0...m_u - 1$  then  $\mathbb{Z}_n = W_0 \cup W_1 \cdots \cup W_{m_u-1}$ , where, in fact,  $W_0 = \langle m_u \rangle$  and  $W_e = W_0 + e$ .

< □ ▶ < @ ▶ < \ > ▶ < \ > ▶ = りへで 34/75

For 
$$\langle r^{m_u} \rangle \leq Gal(L/K)$$
 and  $F_{d_u} = L^{\langle r^{m_u} \rangle}$  let  $\gamma = tr_{L/F_{d_u}}(\alpha) = \sum_{l \in W_0} r^l(\alpha).$ 

We have then:

and ultimately

$$v_{t_{u}x_{u}^{j}} = \sum_{b=0}^{n-1} r^{b}(\alpha) t_{u} x_{u}^{j-b(u+1)} + fr^{b}(\alpha) t_{u} x_{u}^{b(u+1)-uj}$$
$$= \sum_{e=0}^{m_{u}-1} r^{e}(\gamma) t_{u} x_{u}^{j-e(u+1)} + \sum_{e=0}^{m_{u}-1} f(r^{e}(\gamma)) t_{u} x_{u}^{-uj+e(u+1)}$$

Another worthwhile point to consider is that since  $\beta = tr_{L/F}(\alpha)$ , then  $F = K(\beta)$  and  $\beta$  is actually a normal basis generator of F/Kwhere  $f(\beta) = 1 - \beta$ .

As such  $irr_{\mathcal{K}}(\beta) = x^2 + ax + s$ , and since  $f(\beta) = 1 - \beta$  then we must have a = -1 so that  $\beta = \frac{1 \pm \sqrt{1-4s}}{2}$ .

Similarly, since  $\langle r^{m_u} \rangle$  is characteristic in  $\langle r \rangle$  then  $\langle r^{m_u} \rangle \triangleleft Gal(L/K)$ .

As such, since  $\gamma = tr_{L/F_d}(\alpha)$  then  $\gamma$  is a normal basis generator of  $F_{d_u}/F$  and  $F_{d_u} = F(\gamma)$ .

If n = p a prime, then a bit of simplification takes place in that  $\Upsilon_p = \{\pm 1\}$  where u = -1 still corresponds to the group ring  $H_{\rho(D_p)}$  and u = 1 corresponds to the canonical non-classical structure  $H_{\lambda(D_p)}$ .

And in particular, for u = 1 we have  $d_1 = gcd(2, p) = 1$  and  $m_1 = p/1 = p$  so that  $F_{d_1} = L$ , i.e.  $\gamma = \alpha$  and

$$v_{x_1^j} = \beta x_1^j + (1 - \beta) x_1^{-j}$$
$$v_{t_1 x_1^j} = \sum_{e=0}^{p-1} r^e(\alpha) t_1 x_1^{j-2e} + \sum_{e=0}^{p-1} f(r^e(\alpha)) t_1 x_1^{2e-j}$$

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ <

# Multiplying Basis Vectors of $H_{N_u}$

Let us consider how these basis elements multiply with each other. For example

$$\begin{aligned} \mathsf{v}_{\mathsf{x}_u^j} \cdot \mathsf{v}_{\mathsf{x}_u^k} &= (\beta \mathsf{x}_u^j + (1 - \beta) \mathsf{x}_u^{-uj}) (\beta \mathsf{x}_u^k + (1 - \beta) \mathsf{x}_u^{-uk}) \\ &= \beta^2 \mathsf{x}_u^{j+k} + \beta (1 - \beta) \mathsf{x}_u^{j-uk} + \beta (1 - \beta) \mathsf{x}_u^{k-uj} + (1 - \beta)^2 \mathsf{x}_u^{-u(j+k)} \end{aligned}$$

which we can write as a linear combination of the other basis elements, specifically

$$v_{x_{u}^{j}} \cdot v_{x_{u}^{k}} = (1-s)v_{x_{u}^{j+k}} - sv_{x_{u}^{-u(j+k)}} + sv_{x_{u}^{j-uk}} + sv_{x_{u}^{k-uj}}$$

an immediate consequence of which is that  $v_{x_u^j}$ , and  $v_{x_u^k}$  commute with each other, which isn't terribly surprising of course.

A subtle point to observe is that some of the 'n' in the  $v_n$  above may be duplicates.

For example, if u = -1 then

$$egin{aligned} & v_{x_u^j} \cdot v_{x_u^k} = (1-s) v_{x_u^{j+k}} - s v_{x_u^{-u(j+k)}} + s v_{x_u^{j-uk}} + s v_{x_u^{k-uj}} \ &= (1-s) v_{x_u^{j+k}} - s v_{x_u^{(j+k)}} + s v_{x_u^{j+k}} + s v_{x_u^{k+j}} \ &= v_{x_u^{j+k}} \end{aligned}$$

◆□▶ < @ ▶ < E ▶ < E ▶ E りへで 39/75</p>

which is basically reflecting the fact that  $v_{x_{-1}^j} = x_{-1}^j$  and so  $x_{-1}^j x_{-1}^k = x_{-1}^{j+k}$  of course.

More generally,  $v_n = n$  if and only if  $n \in N \cap \rho(G)$ .

In particular, we recall that  $v_{x_u^j} = \beta x_u^j + (1 - \beta) x_u^{-uj} = x_u^j$  if and only if  $j \equiv -uj \pmod{n}$  which is equivalent to  $j \equiv 0 \pmod{m_u}$ . And applied to  $\{j + k, -u(j + k), j - uk, k - uj\}$  we have

$$j + k \equiv -u(j + k) \pmod{n} \Leftrightarrow j + k \equiv 0 \pmod{m_u}$$

$$j + k \equiv j - uk \pmod{n} \Leftrightarrow k \equiv 0 \pmod{m_u}$$

$$j + k \equiv k - uj \pmod{n} \Leftrightarrow j \equiv 0 \pmod{m_u}$$

$$-u(j + k) \equiv j - uk \pmod{n} \Leftrightarrow j \equiv 0 \pmod{m_u}$$

$$-u(j + k) \equiv k - uj \pmod{n} \Leftrightarrow k \equiv 0 \pmod{m_u}$$

$$j - uk \equiv k - uj \pmod{n} \Leftrightarrow j \equiv k \pmod{m_u}$$

which determines how the expression of  $v_{X_{u}^{j^{*}}} \cdot v_{X_{u}^{j^{*}}}$  above condenses  $\sim 40/75$ 

The next product for  $H_{N_u}$  to consider is this

$$\begin{aligned} v_{t_{u}x_{u}^{j}} \cdot v_{t_{u}x_{u}^{k}} &= \left(\sum_{c=0}^{m_{u}-1} r^{c}(\gamma) t_{u} x_{u}^{j-c(u+1)} + \sum_{c=0}^{m_{u}-1} f(r^{c}(\gamma)) t_{u} x_{u}^{-uj+c(u+1)}\right) \\ &\cdot \left(\sum_{e=0}^{m_{u}-1} r^{e}(\gamma) t_{u} x_{u}^{k-e(u+1)} + \sum_{e=0}^{m_{u}-1} f(r^{e}(\gamma)) t_{u} x_{u}^{-uk+e(u+1)}\right) \\ &= \sum_{c=0}^{m_{u}-1} \sum_{e=0}^{m_{u}-1} r^{c}(\gamma) r^{e}(\gamma) x_{u}^{k-j+(c-e)(u+1)} \\ &+ \sum_{c=0}^{m_{u}-1} \sum_{e=0}^{m_{u}-1} r^{c}(\gamma) f(r^{e}(\gamma)) x_{u}^{-uk-j+(c+e)(u+1))} \\ &+ \sum_{c=0}^{m_{u}-1} \sum_{e=0}^{m_{u}-1} f(r^{c}(\gamma)) r^{e}(\gamma) x_{u}^{k+uj-(c+e)(u+1)} \\ &+ \sum_{c=0}^{m_{u}-1} \sum_{e=0}^{m_{u}-1} f(r^{c}(\gamma)) f(r^{e}(\gamma)) x_{u}^{uj-uk-(c-e)(u+1)} \end{aligned}$$

which can also be condensed a bit, and written as a linear combination of the other  $v_n$ .

We have

$$v_{t_{u}x_{u}^{j}} \cdot v_{t_{u}x_{u}^{k}} = \sum_{h=0}^{m_{u}-1} (a_{h} + b_{h}) v_{x_{u}^{k-j+h(u+1)}} + a_{h} v_{x_{u}^{uj-uk-h(u+1)}} + \sum_{h=0}^{m_{u}-1} p_{h} v_{x_{u}^{k+uj-h(u+1)}} + p_{h} v_{x_{u}^{-uk-j+h(u+1)}}$$

#### where

$$tr_{F_d/F}(r^h(\gamma)\gamma) = a_h + b_h\beta$$
  
$$tr_{F_d/F}(f(r^h(\gamma)\gamma)) = f(tr_{F_d/F}(r^h(\gamma)\gamma)) = (a_h + b_h) - b_h\beta$$
  
$$tr_{F_d/F}(r^h(\gamma)f(\gamma)) = p_h$$

< □ ▶ < @ ▶ < ≧ ▶ < ≧ ▶ Ξ → ♡ < ♡ 41/75

The issue is that the values of  $a_h$ ,  $b_h$  and  $p_h$  are dependent on the extension L/F/K, although one can show that:

$$\sum_{h=0}^{m_u-1} tr_{F_d/F}(r^h(\gamma)\gamma) = \beta^2 = -s + \beta$$
$$\sum_{h=0}^{m_u-1} tr_{F_d/F}(f(r^h(\gamma)\gamma)) = (1-\beta)^2 = (1-s) - \beta$$
$$\sum_{h=0}^{m_u-1} tr_{F_d/F}(r^h(\gamma)f(\gamma)) = \beta(1-\beta) = s$$

and so

$$\sum_{h=0}^{m_u-1} a_h = -s \ \sum_{h=0}^{m_u-1} b_h = 1 \ \sum_{h=0}^{m_u-1} p_h = s$$

◆□▶ ◆□▶ ◆ ■▶ ◆ ■ ▶ ● ■ ⑦ Q @ 42/75

The other products, and their representation as (fairly simple!) linear combinations of the  $v_n$  are

$$egin{aligned} & \mathsf{v}_{t_u imes_u^k} \cdot \mathsf{v}_{x_u^j} = (1-s) \mathsf{v}_{tx_u^{k+j}} + (-s) \mathsf{v}_{tx_u^{-u(k+j)}} + s \mathsf{v}_{tx_u^{j-uk}} + s \mathsf{v}_{tx_u^{k-uj}} \ & \mathsf{v}_{x_u^j} \cdot \mathsf{v}_{t_u imes_u^k} = (1-s) \mathsf{v}_{tx_u^{k-j}} + (-s) \mathsf{v}_{tx_u^{-u(k-j)}} + s \mathsf{v}_{tx_u^{-j-uk}} + s \mathsf{v}_{tx_u^{k+uj}} \end{aligned}$$

and the symmetry of the above expressions in j and k leads to a number of identities

$$\begin{split} & \mathsf{v}_{t_u x_u^k} \cdot \mathsf{v}_{x_u^j} = \mathsf{v}_{t_u x_u^j} \cdot \mathsf{v}_{x_u^k} \\ & \mathsf{v}_{x_u^j} \cdot \mathsf{v}_{t_u x_u^k} = \mathsf{v}_{t_u x_u^{-j}} \cdot \mathsf{v}_{x_u^k} \\ & \mathsf{v}_{t_u} \cdot \mathsf{v}_{x_u^j} = \mathsf{v}_{t_u x_u^j} \\ & \mathsf{v}_{t_u} \cdot \mathsf{v}_{x_u^j} = \mathsf{v}_{t_u x_u^j} \\ & \mathsf{v}_{x_u^j} \cdot \mathsf{v}_{t_u} = \mathsf{v}_{t_u x_u^{-j}} \end{split}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

In summary:

$$\begin{split} \mathbf{v}_{x_{u}^{j}} \cdot \mathbf{v}_{x_{u}^{k}} &= (1-s)\mathbf{v}_{x_{u}^{j+k}} - s\mathbf{v}_{x_{u}^{-u(j+k)}} + s\mathbf{v}_{x_{u}^{j-uk}} + s\mathbf{v}_{x_{u}^{k-uj}} \\ \mathbf{v}_{t_{u}x_{u}^{j}} \cdot \mathbf{v}_{t_{u}x_{u}^{k}} &= \sum_{h=0}^{m_{u}-1} (a_{h} + b_{h})\mathbf{v}_{x_{u}^{k-j+h(u+1)}} + a_{h}\mathbf{v}_{x_{u}^{uj-uk-h(u+1)}} \\ &+ \sum_{h=0}^{m_{u}-1} p_{h}\mathbf{v}_{x_{u}^{k+uj-h(u+1)}} + p_{h}\mathbf{v}_{x_{u}^{-uk-j+h(u+1)}} \\ \mathbf{v}_{t_{u}x_{u}^{k}} \cdot \mathbf{v}_{x_{u}^{j}} &= (1-s)\mathbf{v}_{tx_{u}^{k+j}} + (-s)\mathbf{v}_{tx_{u}^{-u(k+j)}} + s\mathbf{v}_{tx_{u}^{j-uk}} + s\mathbf{v}_{tx_{u}^{k-uj}} \\ \mathbf{v}_{x_{u}^{j}} \cdot \mathbf{v}_{t_{u}x_{u}^{k}} &= (1-s)\mathbf{v}_{tx_{u}^{k-j}} + (-s)\mathbf{v}_{tx_{u}^{-u(k-j)}} + s\mathbf{v}_{tx_{u}^{-j-uk}} + s\mathbf{v}_{tx_{u}^{k+uj}} \end{split}$$

<ロ > < 部 > < 言 > < 言 > う < で 44/75

This leads to one immediately interesting (to me at least) consequence about the structure of  $H_{N_u}$ .

#### Theorem

If we define  $H_{N_u}^0 = Span(\{v_{x_u^i}\})$  and  $H_{N_u}^1 = Span(\{v_{t_u x_u^i}\})$  then the above facts about how the basis elements multiply implies that  $H_{N_u}$  can be decomposed as a  $\mathbb{Z}_2$  graded ring  $H_{N_u} = H_{N_u}^0 \oplus H_{N_u}^1$ .

### Proof.

By the above product table for the  $v_n$ , one sees that  $H_{N_u}^i H_{N_u}^j \subseteq H_{N_u}^{i+j}$ . Indeed, one has that  $v_{t_u} v_{x_u^j} = v_{t_u x_u^j}$  so that  $v_{t_u} H_{N_u}^0 \subseteq H_{N_u}^1$  and therefore  $v_{t_u} H_{N_u}^0 = H_{N_u}^1$ .

# A Worked Out Example in Degree 6

For  $K = \mathbb{Q}$  we construct a Galois extension L/K with  $Gal(L/K) \cong D_3$ . First, define  $p(x) = x^3 - 2 \in K[x]$  which has roots w,  $\zeta w$ ,  $\zeta^2 w$  where  $w = \sqrt[3]{2}$  and  $\zeta = e^{\frac{2\pi i}{3}}$ . We have that  $Gal(L/K) = \langle r, f \rangle$  where

$$r(w) = \zeta w$$
$$r(\zeta) = \zeta$$
$$f(w) = w$$
$$f(\zeta) = \zeta^{2}$$

so that |r| = 3 and |f| = 2 and  $Gal(L/K) \cong D_3$ . One may verify that

$$\alpha = \frac{1}{3} \sum_{i=0}^{1} \sum_{j=0}^{2} \zeta^{i} w^{j}$$

is a normal basis generator for L/K where  $tr_{L/K}(\alpha) = 1$ .

◆□ ▶ ◆□ ▶ ◆ 三 ▶ ◆ 三 ▶ ○ ○ ◆ 46/75

As  $F = L^{\langle r \rangle}$  then  $\beta = tr_{L/F}(\alpha) = \zeta + 1$  is a normal basis generator for F/K where  $tr_{F/K}(\beta) = \beta + f(\beta) = 1$  and  $irr_{F/K}(\beta) = x^2 - x - 1$  which means  $F = \mathbb{Q}(\sqrt{-3})$ .

Now, since  $\Upsilon_3 = \{1, -1\}$  then  $R(D_3, [D_3]) = \{\lambda(D_3), \rho(D_3)\}$  so the 'interesting' Hopf algebra action is by  $N_1 = \lambda(D_3)$  corresponding to  $u = 1 \in \Upsilon_3$  so that  $d_1 = gcd(u+1,3) = 1$  and  $m_1 = 3$  and so, as observed earlier,  $F_{d_1} = L$  and  $\gamma = \alpha$ .

< □ > < □ > < □ > < ≧ > < ≧ > ≧ → のへで 51/75

The goal is to show that even though none of the  $H_{N_u}$  are isomorphic as Hopf-algebras, they are isomorphic as *K*-algebras.

An ad-hoc approach/example in the  $D_3$  case is to utilize the  $v_n$  basis to construct matrix units, and therefore an explicit isomorphism  $(\mathcal{K}[\lambda(D_3)])^{D_3} = H_{N_1} \rightarrow H_{N_{-1}} = \mathcal{K}[\rho(D_3)].$ 

This is made easier by the knowledge of the multiplication table for the  $\{v_n\}$  we just explored.

◆□ ▶ < @ ▶ < E ▶ < E ▶ ○ 2 つくで 52/75</p>

We know that  $K[D_3] \cong K \times K \times M_2(K)$  is the Wedderburn decomposition so the difficulty is in finding a 'copy' of  $M_2(K)$  inside  $H_{N_1}$ , namely a set of matrix units.

Consider

$$h_{1,1} = \frac{1}{3}(v_{x_1^0} - v_{x_1^2})$$

$$h_{1,2} = \frac{1}{6}(v_{t_1} - v_{t_1x_1})$$

$$h_{2,1} = \frac{1}{3}(v_{t_1} - v_{t_1x_1^2})$$

$$h_{2,2} = \frac{1}{3}(v_{x_1^0} - v_{x_1})$$

which we assert correspond to the elementary  $2 \times 2$  matrices  $\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$ ,  $\begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$ ,  $\begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}$ ,  $\begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$ .

If the character values of  $D_3$  lie in K then the orthogonal idempotents

$$e_{\chi_i} = rac{\chi_i(1)}{|D_3|} \sum_{g \in D_3} \chi_i(g^{-1})g$$

lie in  $K[D_3]$ .

There are two 1-d characters  $\chi_1$  and  $\chi_2$ , where  $\chi_1(g) = 1$  for all  $g \in D_3$ ,  $\chi_2(x_1^i) = (-1)^i$ ,  $\chi_2(t_1x_1^i) = 0$ , as well as the 2-d character  $\chi_3$  where  $\chi_3(1) = 2$ ,  $\chi_3(x_1) = -1$ ,  $\chi_3(x_1^2) = -1$ ,  $\chi_3(t_1x_1^j) = 0$ 

◆□ ▶ < @ ▶ < E ▶ < E ▶ ○ 2 · ○ Q ○ 54/75</p>

In particular we obtain

$$\begin{split} e_{\chi_1} &= \frac{1}{6}(t_1 x_1^2 + t_1 x_1 + t_1 + x_1^2 + x_1 + 1) \\ e_{\chi_2} &= \frac{1}{6}(-t_1 x_1^2 - t_1 x_1 - t_1 + x_1^2 + x_1 + 1) \\ e_{\chi_3} &= \frac{1}{3}(2 - x_1 - x_1^2) \end{split}$$

but what is quite extraordinary is how these may be represented in terms of the v-basis, namely that they actually reside in  $H_{N_1} = (K[\lambda(D_3)])^{D_3}$ .

◆□ ▶ < @ ▶ < E ▶ < E ▶ ○ Q ○ 55/75</p>

Specifically

$$egin{aligned} e_{\chi_1} &= rac{1}{6}(t_1x_1^2 + t_1x_1 + t_1 + x_1^2 + x_1 + 1) \ &= rac{1}{6}(v_{t_1x_1^2} + v_{t_1x_1} + v_{t_1} + v_{x_1^2} + v_{x_1} + v_{x_1^0}) \end{aligned}$$

$$egin{aligned} e_{\chi_2} &= rac{1}{6} ig( -t_1 x_1^2 - t_1 x_1 - t_1 + x_1^2 + x_1 + 1 ig) \ &= rac{1}{6} ig( -v_{t_1 x_1^2} - v_{t_1 x_1} - v_{t_1} + v_{x_1^2} + v_{x_1} + v_{x_1^0} ig) \end{aligned}$$

$$e_{\chi_3} = \frac{1}{3}(2 - x_1 - x_1^2)$$
$$= \frac{1}{3}(2v_{x_1^0} - v_{x_1} - v_{x_1^2})$$

and the idempotent  $e_{\chi_3}$  is used to obtain the  $h_{i,j}$ .

What we have then is that  $H_{N_1} = H_{\lambda}$  (expressed in its Wedderburn form as  $K \times K \times Mat_2(K)$ ) has basis  $\{e_{\chi_1}, e_{\chi_2}, h_{1,1}, h_{1,2}, h_{2,1}, h_{2,2}\}$ , which are all expressed in terms of the  $v_{t_1^i \times t_1^j}$  basis vectors, explicitly

$$\begin{pmatrix} a, b, \begin{bmatrix} c & d \\ e & f \end{bmatrix} \end{pmatrix} \mapsto ae_{\chi_1} + be_{\chi_2} + ch_{1,1} + dh_{1,2} + eh_{2,1} + fh_{2,2}$$

where, for example, we can see where the identity element of the direct product gets mapped

$$egin{pmatrix} 1,1, egin{bmatrix} 1 & 0 \ 0 & 1 \end{bmatrix} \mapsto e_{\chi_1} + e_{\chi_2} + h_{1,1} + h_{2,2} = v_{x_1^0} \end{split}$$

◆□ ▶ < @ ▶ < E ▶ < E ▶ ○ E · ○ Q ○ 57/75</p>

which is congruous with the observation earlier that  $v_{x_1^0}$  is the identity element of  $H_{N_u}$ .

As an interesting computational aside, the sub-algebra  $H_{N_1}^0 = Span(\{v_{\chi_1^j}\})$  can also be written as  $Span(\{e_{\chi_1} + e_{\chi_2}, h_{1,1}, h_{2,2}\})$ , namely as those elements of the form

$$\begin{pmatrix} a, a, \begin{bmatrix} b & 0 \\ 0 & f \end{bmatrix}$$

and similarly  $H_{N_1}^1 = Span(\{v_{t_1x_1^j}\}) = Span(\{(e_{\chi_1} - e_{\chi_2}), h_{1,2}, h_{2,1}\})$  which equals

$$\begin{pmatrix} a, -a, \begin{bmatrix} 0 & c \\ d & 0 \end{bmatrix}$$
)

◆□ ▶ ◆ □ ▶ \bullet ■ ▶ ◆ □ ▶ \bullet ■ ▶ ◆ □ ▶ \bullet ■ ■ ▶ \bullet ■ ■

Going further, we can view  $H_{N_1} = H_{\lambda}$  as a group ring in a kind of natural way. One may show that in  $M_2(K)$  one has matrices

$$X = \begin{bmatrix} 0 & 1 \\ -1 & -1 \end{bmatrix}$$
$$T = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

which can be shown satisfy the equations  $X^3 = I$ ,  $T^2 = I$  and  $XT = TX^2$  so that  $\langle X, T \rangle \cong D_3$  and therefore have elements (units) of the Wedderburn decomposition of  $H_{N_1}$  which also satisfy these relations, namely  $h_X = (1, 1, X)$  and  $h_T = (1, 1, T)$ .

◆□ ▶ < @ ▶ < E ▶ < E ▶ ○ 2 · ○ Q ○ 59/75</p>

What we would like is to show that

$$\{1, h_X, (h_X)^2, h_T, h_T h_X, h_T (h_x)^2\} = \{(1, 1, I), (1, 1, X), (1, 1, X^2), (1, 1, T), (1, 1, TX), (1, 1, TX^2)\}$$

are yet a different basis for  $H_{N_1}$ .

As it turns out, one must adjust  $h_T$ , and set it to be (1, -1, T) in order to achieve linear independence, which yields the set

 $\{(1,1,I),(1,1,X),(1,1,X^2),(1,-1,T),(1,-1,TX),(1,-1,TX^2)\}$ 

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ <

which is linearly independent.

The five 2 × 2 matrices X, X<sup>2</sup>, T, TX, TX<sup>2</sup> cannot be a linearly independent subset of  $M_2(K)$ . And in terms of the basis  $\{e_{\chi_1}, e_{\chi_2}, h_{1,1}, h_{1,2}, h_{2,1}, h_{2,2}\}$  one has

$$\begin{split} 1 &= 1e_{\chi_1} + 1e_{\chi_2} + 1h_{1,1} + 0h_{1,2} + 0h_{2,1} + 1h_{2,2} \\ h_X &= 1e_{\chi_1} + 1e_{\chi_2} + 0h_{1,1} + 1h_{1,2} + (-1)h_{2,1} + (-1)h_{2,2} \\ (h_X)^2 &= 1e_{\chi_1} + 1e_{\chi_2} + (-1)h_{1,1} + (-1)h_{1,2} + 1h_{2,1} + 0h_{2,2} \\ h_T &= 1e_{\chi_1} + (-1)e_{\chi_2} + 0h_{1,1} + 1h_{1,2} + 0h_{2,1} + 1h_{2,2} \\ h_T h_X &= 1e_{\chi_1} + (-1)e_{\chi_2} + (-1)h_{1,1} + (-1)h_{1,2} + 0h_{2,1} + 1h_{2,2} \\ h_T (h_X)^2 &= 1e_{\chi_1} + (-1)e_{\chi_2} + 1h_{1,1} + 0h_{1,2} + (-1)h_{2,1} + (-1)h_{2,2} \end{split}$$

and, for reference, we can represent  $h_X$  and  $h_T$  in terms of the v basis.

$$h_X = \frac{2}{3}v_{x_1} + \frac{1}{3}v_{x_1^2} - \frac{1}{6}v_{t_1} - \frac{1}{6}v_{t_1x_1} + \frac{1}{3}v_{t_1x_1^2}$$
$$h_T = \frac{5}{6}v_{t_1} + \frac{1}{6}v_{t_1x_1}$$

< □ > < □ > < □ > < Ξ > < Ξ > Ξ > ⑦ < ♡ 62/75

So we have (in a kind of bare-handed way) demonstrated the following:

#### Theorem

If  $D_3 = \langle x, t | x^3 = t^2 = 1, xt = tx^2 \rangle$  then there is a K-algebra isomorphism  $\psi : K[D_3] \to H_{N_1}$  given by  $\psi(x) = h_X$  and  $\psi(t) = h_T$ .

# **Idempotents in** *H<sub>N</sub>*

The similarity of the expression of the idempotents expressed in terms of the group elements and the v basis, e.g.

$$e_{\chi_1} = \frac{1}{6}(t_1x_1^2 + t_1x_1 + t_1 + x_1^2 + x_1 + 1)$$
  
=  $\frac{1}{6}(v_{t_1x_1^2} + v_{t_1x_1} + v_{t_1} + v_{x_1^2} + v_{x_1} + v_{x_1^0})$ 

makes one wonder if there is, more generally, a direct analogue of the  $e_{\chi_i}$  framed in terms of the  $v_n$ ?

Conjecture/Question: If  $H_{\lambda}$  contains all the central idempotents as the group ring  $H_{\rho}$  does that imply that  $H_{\lambda} \cong H_{\rho}$ ? Consider the following.

# Definition For $N \in R(G)$ and $\{v_n\}$ the basis for $H_N = (L[N])^{\lambda(G)}$ let

$$v_{\chi} = \frac{\chi(e_N)}{|N|} \sum_{n \in N} \chi(n^{-1}) v_n$$

for each irreducible character  $\chi: N \to K$  of N.

We model this on the usual idempotent definition  $e_{\chi} = \frac{\chi(e_N)}{|N|} \sum_{n \in N} \chi(n^{-1})n \in K[N].$ 

The first question is whether these  $v_{\chi}$  are similarly orthogonal idempotents. Under some assumptions on  $\chi$  we can show more in fact.

### Theorem

For  $N \in R(G)$  and  $v_{\chi}$  as defined above, if  $\chi$  is real valued and all character values lie in K, and  $\chi(\lambda(g)n\lambda(g)^{-1}) = \chi(n)$  for all  $n \in N$  and  $g \in G$  then  $v_{\chi} = e_{\chi}$ .

### Proof:

By assumption  $\chi(n^{-1}) = \overline{\chi(n)} = \chi(n)$  and so:

$$\begin{aligned} v_{\chi} &= \frac{\chi(e_N)}{|N|} \sum_{n \in N} \chi(n^{-1}) v_n \\ &= \frac{\chi(e_N)}{|N|} \sum_{n \in N} \sum_{g \in G} \chi(n^{-1}) g(\alpha) \lambda(g) n \lambda(g)^{-1} \\ &= \frac{\chi(e_N)}{|N|} \sum_{g \in G} g(\alpha) \sum_{n \in N} \chi(n^{-1}) \lambda(g) n \lambda(g)^{-1} \\ &= \frac{\chi(e_N)}{|N|} \sum_{g \in G} g(\alpha) \sum_{n \in N} \chi(n) \lambda(g) n \lambda(g)^{-1} \\ &= \frac{\chi(e_N)}{|N|} \sum_{g \in G} g(\alpha) \sum_{n \in N} \chi(\lambda(g) n \lambda(g)^{-1}) \lambda(g) n \lambda(g)^{-1} \end{aligned}$$

$$= \frac{\chi(e_N)}{|N|} \sum_{g \in G} g(\alpha) \sum_{m \in N} \chi(m)m$$
$$= \frac{\chi(e_N)}{|N|} \sum_{g \in G} g(\alpha) \sum_{m \in N} \chi(m^{-1})m$$
$$= \frac{\chi(e_N)}{|N|} \sum_{m \in N} \chi(m^{-1})m$$
$$= e_{\chi}$$

where the second to last line is due to the assumption that  $tr_{L/K}(\alpha) = 1$ , which completes the proof.

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ <

As a corollary, we have the following.

## Corollary

For  $N \in R(G)$  and  $v_{\chi}$  as defined above, if  $\chi$  is real valued and all character values lie in K and the action of  $\lambda(G)$  on N is by inner automorphisms, then  $v_{\chi} = e_{\chi}$ 

## Proof.

If conjugation by every  $\lambda(g)$  induces an inner automorphism of N then all conjugacy classes are preserved and therefore all character values are preserved.

< □ ▶ < @ ▶ < \ > ▲ \ > ↓ \ = りへで 68/75

As a result, we have some immediate examples.

If G is such that all its irreducible character values are real and lie in K then for  $N = \lambda(G), \rho(G)$  one has  $v_{\chi} = e_{\chi}$ .

Of course, the upshot of this is that for these N the Hopf algebras  $H_N$  contain the same orthogonal idempotents as does K[N] itself (and therefore has identical Wedderburn decomposition to that of K[N]?)

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ <

### Corollary

If  $N \in R(G)$  and  $\chi$  is a real valued irreducible character of N such that all values of  $\chi$  lie in K and  $\chi(\lambda(g)n\lambda(g)^{-1}) = \chi(n)$  for all  $n \in N$  and  $g \in G$  then  $e_{\chi} \in H_N$ .

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - 釣�♡ 70/75

For  $D_n$ , the question is, for what irreducible character(s)  $\chi$  do we have  $\chi(\lambda(g)n\lambda(g)^{-1}) = \chi(n)$  for every  $n \in N$  where  $N \in \mathcal{H}(D_n)$ ? Given  $N_u \in \mathcal{H}(D_n)$  where  $N_u = \langle x_u, t_u \rangle$  and where  $\lambda(G) = \langle r, f \rangle$  acts by

$$rx_{u}r^{-1} = x_{u}$$

$$rt_{u}r^{-1} = t_{u}x_{u}^{-(u+1)}$$

$$fx_{u}f^{-1} = x_{u}^{-u}$$

$$ft_{u}f^{-1} = t_{u}$$

◆□▶ < @ ▶ < E ▶ < E ▶ E りへで 71/75</p>

we look at whether each  $\chi$  is  $\lambda(G)$ -invariant.

If *n* is even then the 1-d irreps are  $\chi_1$ ,  $\chi_2$ ,  $\chi_3$ , and  $\chi_4$  where

	x <sub>u</sub> <sup>j</sup>	$t_u x_u^j$
$\chi_1$	1	1
χ2	1	-1
χз	$(-1)^{j}$	$(-1)^{j}$
χ4	$(-1)^{j}$	$(-1)^{j+1}$

and for *n* odd,  $\chi_3$  and  $\chi_4$  aren't defined.

Clearly  $\chi_1$  and  $\chi_2$  are  $\lambda(G)$ -invariant, and for n even,  $u \in \Upsilon_n$  must be odd, and so u + 1 must be even and so  $j - (u + 1) \equiv j \pmod{2}$  and  $j \equiv -ju \pmod{2}$  and so  $\chi_3$  and  $\chi_4$  are as well.

◆□▶ < @ ▶ < E ▶ < E ▶ E りへで 72/75</p>

For the two dimensional irreps  $\chi^h$  where  $\chi^h(t_u x_u^j) = 0$  and  $\chi^h(x_u^j) = 2\cos(\frac{2hj\pi}{n})$  for  $0 < h < \frac{n}{2}$  the question is whether

$$\cos\left(\frac{2hj\pi}{n}\right) = \cos\left(\frac{-2huj\pi}{n}\right)$$

for  $u \in \Upsilon_n$ ?

And here is where a problem arises, namely the above equality holds (for all  $h \in (0, \frac{n}{2})$ ) only if  $u = \pm 1$ , i.e. for  $N_1 = \lambda(D_n)$  and  $N_{-1} = \rho(D_n)$ .

But at least we can conclude that  $H_{\lambda} = H_{N_1} \cong H_{N_{-1}} = H_{\rho}$  for all n, not just n = 3, or even n a prime necessarily.

<□ ▶ < □ ▶ < 三 ▶ < 三 ▶ ミ ● ○ Q (P 73/75

Questions:

(1) Does the fact that  $e_{\chi} \in H_{N_1} = H_{\lambda}$  for each irreducible character  $\chi$  imply that  $H_{N_1}$  has the same Wedderburn decomposition as  $H_{N_{-1}} = H_{\rho} = K[\rho(D_n)]$ ?

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

(2) For those irreducible characters  $\chi$  which are not  $\lambda(G)$ -invariant, are the  $v_{\chi}$  idempotent? central? (even if they don't lie in  $K[\rho(D_n)]$ ?)

Thank you!
